## 'Read Only' Issues

### Description of Problem:

The display value for a read-only field is not set correctly on a web client when using a read-only condition.

### Workaround:

As a workaround, you can modify the topaz.js file under the \js directory in the web-tier.

1. Search for the following function  
"function setComfillReadonly(field, sValue)"  
in the topaz.js file.

You will see the following lines in this function:

```
if (dvdTrue(sValue))  
{  
    field.style.display = "none";  
    field.style.visibility = "hidden";  
    fieldReadonly.style.display = "";  
    fieldReadonly.style.visibility = "";
```

2. After the line that executes: `fieldReadonly.style.visibility = ""`;  
add the following line `fieldReadonly.value = field.value`;

3. Finally restart the application server (tomcat, WAS, etc).
